Konya Province Gelatin Production Pre-Feasibility Report

2020
NOVEMBER

SCOPE OF THE REPORT

This pre-feasibility report has been prepared by the Mevlana Development Agency, which operates under the coordination of the Ministry of Industry and Technology, to determine the appropriateness of the establishment of a gelatin production facility in Konya, to inform investors, to offer investment ideas for investors and to provide a basis for detailed feasibility studies.

RIGHTS STATEMENT

This report has been prepared for general guidance only to those concerned. The information and analyzes in the report have been written for the purpose of guiding and informing investors, using resources and information believed to be accurate and reliable at the time the report was prepared. The responsibility for evaluating and using the information in the report, directly or indirectly, belongs to the persons and institutions that make investment decisions or provide financing based on this report. The Ministry of Industry and Technology and Mevlana Development Agency cannot be held responsible against those who take an action, do not act or take a decision based on the information in this report.

All rights of this report belong to Mevlana Development Agency. Since the images and information in the report may be subject to copyright, this report cannot be used outside the framework it serves under any circumstances. Therefore; without the written consent of Mevlana Development Agency, the content of the report cannot be copied partially or completely, printed, reproduced, copied or duplicated in any way by electronic, mechanical or similar means, distributed, quoted without reference

2. ECONOMIC ANALYSIS

1.1. Sector Description

Gelatin is produced by subjecting the skin, bone and connective tissues of animals such as pigs, cattle and very few fishes to certain production processes. The basic raw material of the gelatin planned to be produced in the facility subject to feasibility is animal bovine bones. Gelatin is a protein substance found in the tissues of mammals, in the parts binding muscles to bones, bones to each other and other organs, and skin, and is extracted from collagen, a protein. When boiled with water, collagen in the skin, bones and connective tissues of animals (mostly cattle and pigs) turns into a water-soluble protein known as gelatin. When cooled, the solution does not turn into collagen; but it turns into a gel. Gelatin is used in many sectors due to its properties such as strong shaping ability, transparent gel forming, flexible film, easy to digest, melting in hot water and easy to shape; it is used in many areas especially in food production.

Activity classifications are classifications that divide the data about all statistical units operating in the economic field into homogeneous categories and present them, determine the main activities of the units and provide international comparison. ISIC (International Standard Industrial Classification) is the classification of economic activities prepared by the United Nations Statistics Office and recommended to be used all over the world. According to ISIC Revised 3.1 classification; detailed codes for gelatin and related products are given below:

Table 1. ISIC Revised 3.1 Code List

| Code | Defination |
|---------------|---|
| 24.29 | Manufacture of Chemical Products Not Otherwise Classified |
| 24.29.2 | Glue and Gelatin Manufacturing |
| 24.29.2.01 | Glue and Gelatins |
| 24.29.2.01.30 | Gelatin and Gelatin Derivatives (except casein glues) |
| 24.29.2.01.33 | Gelatin and Gelatin Derivatives-Used for Food |
| 24.29.2.01.35 | Gelatin and Gelatin Derivatives-Pharmaceuticals |
| 24.29.2.01.37 | Gelatin and Gelatin Derivatives-Used forTechnical |
| 24.29.2.01.50 | Bone Glues and other gelatins |

NACE (Nomenclature Generale des Activities Economiques dans les Communautés Européennes) is the economic activity classification derived from the ISIC classification by the European Union countries and used by the member countries. In NACE Rev 2 of the Statistical Classification of Economic Activities in the European Community started to be implemented by Turkey Statistical Institute (TUIK) as of the beginning of 2008, gelatin production is classified in the Manufacture section (C), Section of Manufacture Chemicals and Chemical products (20), Manufacture of Other Chemical Products (205),

under Manufacture of Other Chemical Products Not Elsewhere Classified (2059), and Manufacture of Gelatin and Gelatin Derivatives and Dairy Albumin (205911).

Customs Tariff Statistics Position (CTSP) codes for gelatin are given below.

Table 2. CTSP List

| Code | Defination |
|--------------|---|
| VI | Chemical Industry and Related Industry Products |
| 35 | Albinoid substances, glues, enzymes |
| 3503 | Gelatin, gelatin derivatives, fish glue, animal glues |
| 350300 | Gelatin, gelatin derivatives, fish glue, animal glues |
| 35030010 | Gelatin and Gelatin Derivatives |
| 350300101000 | Gelatin |
| 350300102000 | Gelatin Derivatives |

1.2. Supports for the Sector

One of the incentives used in promoting investments in a country is investment incentive measures. Incentives are financial or non-financial support and assistance mechanisms that aim to increase production and employment by increasing investments. Investment incentives are frequently used by governments to ensure the development of sectors, especially in less developed regions.

The process of benefiting from the incentives quickly and effectively starts at the application stage, and it is of great importance to reduce bureaucracy. In order to achieve this, some chambers of industry and development agencies have been authorized for incentives, with some exceptions. In addition, with the Authorization Communiqué published in the Official Gazette dated May 31, 2018, Investment Incentive Certificate applications and related transactions to be made as of July 2, 2018 have been transferred to the electronic media. The applications to be made after this date and the transactions regarding the incentive certificates to be issued will be carried out electronically. Investment Incentive Certificate applications will be made to the Ministry of Industry and Technology via E-TUYS (Electronic Incentive Application and Foreign Capital Information System) as of this date, and the option of applying to local units where the investment will be made in the pre-regulation Decision is thus eliminated.

In order to implement the investment incentive program prepared in 2012, regions were classified into 81 provinces and 6 regions, taking into account their socio-economic development levelsn(Socio-Economic Development Index - SEGE 2011). In the new application, the provincial regional incentive system has been introduced instead of the regional system, and Konya has been included in the 2nd

Region. As the level increase, the amount of incentives increase for fostering investments in relatively less developed regions.

This investment to be made in Konya will benefit from general and regional incentive system; the investment topics that will benefit from regional aids have been determined taking into account the investment potential and the competitive power of each province group and have been shown in the list given in the second annex to the Decision on State Aids in Investments number 2012/3305 published in the Official Gazette dated 19.06.2012, numbered 28328.

Gelatin production is included in the manufacture of chemicals and products (24) according to the National Activity and Product Classification. The minimum fixed investment amount for the manufacture of chemicals and products is 3 million Turkish Liras for the 2nd Region, where Konya is also located.

Gelatin production facility investments are considered as "mid-high tech investment" and can benefit from 4th region incentives even though Konya is a 2nd region province. This investment can benefit from customs tax exemption, VAT (value added tax) exemption, 45% or 55% indirect investment contribution, 100% tax reduction, the support of employer's national insurance contrinution share and investment place allocation.

Table 3. Available Investment Support Elements

| Incentives | | | Konya |
|--|--|-------------------|-----------|
| Customs Duty Exemption | | | Available |
| VAT Exemption | | | Available |
| Tax Reduction | Contribution Rate to Investment | OIZ and Out of IZ | 30/45* |
| | | In OIZ and IZ | 40/55* |
| Insurance Premium Employer's Share Support | Support Duration | Out of OIZ and IZ | 6 years |
| | | In OIZ and IZ | 7 years |
| Investment Place Allocation | | | Available |
| Interest or Dividend Support | Domestic Loan | | 4 points |
| | Foreign Currency / Foreign Currency Indexed Loan | | 1 points |

() High tech products*

Within the framework of incentive system, certificates issued for the manufacturing industry (US-97 Code: 15-37), the investment contribution rate for investment expenditures to be realized between 1/1/2020 and 31/12/2022 is applied without any action on the incentive certificate, adding 15 points to the investment contribution rate valid in each region, corporate tax or income tax deduction being 100% in all and the investment contribution amount to be applied to the investor's earnings from other investments during the investment period being 100% (Official Gazette dated 30.12.2019, numbered 30994).

1.3. Sector Profile

1.3.1. Description of Goods

Gelatin is a protein produced by the partial hydrolysis of collagen commercially extracted from bovine skin and bones, pork and fish skins under controlled conditions.¹

Gelatin is offered for sale in five basic categories: edible, pharmaceutical, technical, photographic and hydrolyzed categories, according to the characteristics of the final product. The majority of gelatin products are edible and of pharmaceutical nature. Commercially produced edible gelatin consists of 84-90% protein, 8-12% water and 2-4% mineral salts, and 100 grams have a nutritional value of approximately 350-400 kcal.

Gelatin is classified as Type A and Type B in terms of its production method. Type A gelatin is produced by treating cattle, pig and fish skins with acid before extraction. In Type B gelatin, bovine bones and skins are pre-treated with alkali before extraction. Type B gelatin will be produced using cattle bones and alkaline pre-treatment.

The list of laws, regulations and communiqués related to agriculture and livestock to which the gelatin sector is directly related are presented in the table below.

Table 4. Some Laws, Regulations and Communiqués

| | | |
|--|--|------------------------------------|
| Law no. 5179 | Law on the amendment and adoption of the Decree Law on the production, consumption and supervision of food | 05.06.2004 OG No: 25483 |
| Regulation | Food Hygiene Regulation | 17.12.2011 OG No: 28145 |
| Meat Products Communiqué: 2018/52 | Turkish Food Codex Meat, Prepared Meat Mixtures and Meat Products Communiqué | 29.01.2019 OG No: 30670 |
| Product Safety And Control: 2020/5 | Notification of Import Control of Products Subject to the Control of the Ministry of Agriculture and Forestry | 27.12.2019 OG No: 30991 |

1.3.2. Usage Areas

Gelatine is an important industrial additive widely used in the food, cosmetic, pharmaceutical, photography and paint industries. Gelatin is mainly used as an adhesive, thickener, antifoam and emulsifier.

1 Gelatin as a Food Additive: Structure, Properties, Production, Use and Quality / Yüzüncü Yıl University, Department of Food Engineering

Table 5.Industrial Products Using Gelatin and Usage Purpose

| Product Used in | Purpose |
|--|---|
| Sweets and Confectionery | Gives flexibility, improves chewing properties, extends the shelf life. |
| Dairy products | Gives flexibility, increases consistency, improves the structural properties. |
| Bakery and Pastry Products | Preserves the structure of the filling material, improves the emulsion properties. Protects from the damages of the freezing process. |
| Meat, Fish and Sausage | It is used as an edible protective coating, improves the appearance. Extends shelf life |
| Pharmaceutical Capsules and Tablets | It is an essential component of hard and soft capsules. It protects the medicine from the harmful effects of oxygen and light. |
| Vitamin Products | It protects vitamins from the harmful effects of oxygen and light. Extends shelf life. |
| Photo Products | It takes part in the development of the movie. Used for graphic film and color photo paper, makes the colors come out bright. |
| Juice | It is used for precipitation. It plays a role in the formation of a homogeneous and transparent structure. |
| Match | It is used to hold the match ends to the wooden handle. |
| Paper and Book | Used for repairing books. It is used to increase the water resistance of paper products. It is used to give strength and hardness to paper. |
| Chemical Products | It is used in the production of high purity materials. |

Source: Gelatin as a Food Additive: Structure, Properties, Production, Use and Quality / Yüzüncü Yıl **University, Department of Food Engineering**

Gelatin is generally used as a stabilizer or gelling agent in foods. Enriching foods in terms of protein and reducing the ratio of fat and carbohydrates are also among the areas of use of gelatin. Gelatin undertakes various functions depending on the product produced. For example, it s used as a gelling agent in jelly desserts, meats, confectionery and meat sauces; as a structuring agent in Turkish delights, nougat, creams, soufflés; as a binding agent in roll meats, canned meats, cheeses and dairy products. Similarly, it is used in confectionery, ice cream, frozen products and frozen desserts to preserve the colloidal structure; it is used as a clarifying agent in fruit juices, as a stabilizer in powdered drinks, broths, sauces, soups, puddings, jellies, syrups and dairy products. It is also used as an emulsifier in soups, sauces, sweeteners, meat and dairy products; as a stabilizer in cream cheese,

yoghurt and frozen products; as a sticking agent in confectionery and meat products; in confectionery, creams and ice cream to provide foaming; as a crystallization regulator in ice creams, ice products and frozen desserts. On the other hand, gelatin hydrolysates are used in the clarification of beer, wine and fruit juices as well as adding to foods.

Modern silver bromide materials used in photography are produced from emulsions containing gelatin. It works as a support material for the gelatin film layer in these emulsions. Gelatin, which started to be used in the photography industry about a century ago, has recently been demanded for the production of X-ray films.

Gelatin is widely used in serums (as a plasma substitute), hard and soft capsules, vitamin coating materials, drops, tablets, in droplets production, paste coatings, toothpaste production, in microorganism cultures as a nutrient medium, in the production of sponges and formulations of newly developed vaccines.

Bovine, porcine and fish origin collagen and gelatins are products that are used in hair and skin care products and perform important functions. For example, gelatin hydrolysates are added to skin care kits to increase water binding capacity, reduce trans-epidermal water loss and heal skin.

Figure 1. Distribution of Gelatin According to Usage Areas

1.3.3. Current Situation of Turkey Gelatin Sector

Gelatin production in Turkey is performed by four companies namely Balıkesir (**Sel Sanayi Ürünleri Ticaret ve Pazarlama A.Ş. - SelJel**), Bursa (**Bursa Gelatin Gıda San.ve Tic. A.Ş.**), İstanbul (**Halavet Gıda Sanayi ve Ticaret A.Ş.**) and Kocaeli (**BB Tarım Gıda Mühendislik AR-GE Sanayi ve Ticaret Ltd.Şti.**), and according to TOBB Database, the total production capacity of these companies is 9,861,600 kg. These companies use cowhide as a raw material in the production of food gelatin.

Turkey's first manufacturer of gelatin SelJel Sanayi has been established as a manufacturer of glue/technical gelatin from cowhide in Balıkesir in 1961. In 2010, Sel Sanayi started to produce halal food gelatin from cattle hides under the Seljel brand.

Bursa Gelatin Gıda, which operates in the province of Bursa, started gelatin production in 2019 based on its experience in the leather sector. Halal edible cattle gelatin is produced in the facility established on an area of 20,000 m².

The other gelatin producers are Halavet company operating in İstanbul and BB Tarım Gıda Mühendislik company operating in Kocaeli.

Turkey Statistical Institute (TSI) does not disclose the information regarding the sectors with a low number of producers within the framework of the Confidentiality Principle, and the producers in the sector do not share information about their installed capacities on company basis for various reasons. For this reason, the table below shows the total production capacity of the companies.

Table 6. Turkey Gelatin Production Capacity

| Province | Registered Producer | Staff | | | | | | Production Capacity |
|-----------|---------------------|-------|----|----|-----|----|-------|---------------------|
| | | E | T | C | W | A | Total | KG |
| Balıkesir | 1 | 5 | 8 | 6 | 159 | 24 | 202 | * |

| Kocaeli | 1 | 3 | 1 | 0 | 4 | 0 | 8 | * |
| Total | 4 | 17 | 23 | 14 | 262 | 38 | 354 | 9,861,600 |

E: Engineer; T: Technician; C: Craftsman; W: Worker; A: Administrative staff;

** If the number of registered producers is 4 or less, production capacity information is not provided.*

Source: TOBB Industry Database, Access Date August 2020

According to the news of Anadolu Agency, a 6,000 tons capacity leather gelatin processing facility is being established in Bolu. It is understood that the facility was established in Bolu in order to benefit

from Leather Specialized OIZ and in terms of proximity to raw material supply, and the capacity is kept higher as it is planned to switch to collagen production at the next stage².

1.3.4. Current Situation of World Gelatin Sector

Gelatin is a product which has been produced for years across the world by numerous countries. World gelatin production is made by a few firms and they share the global market.

Figure 2. World Gelatin Import Map

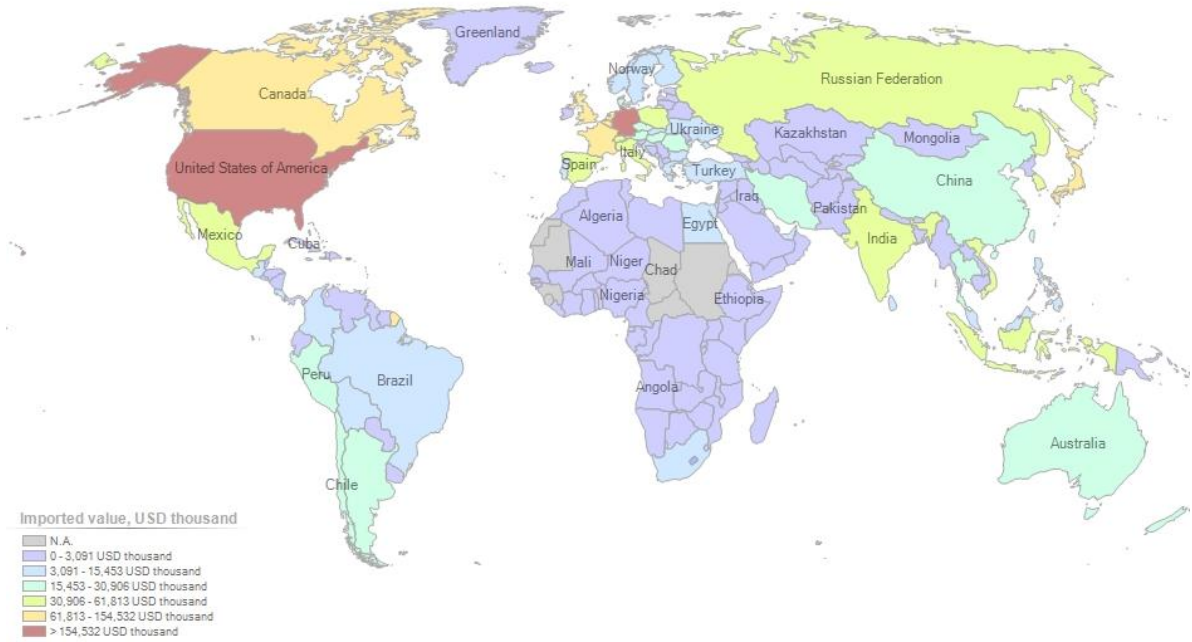

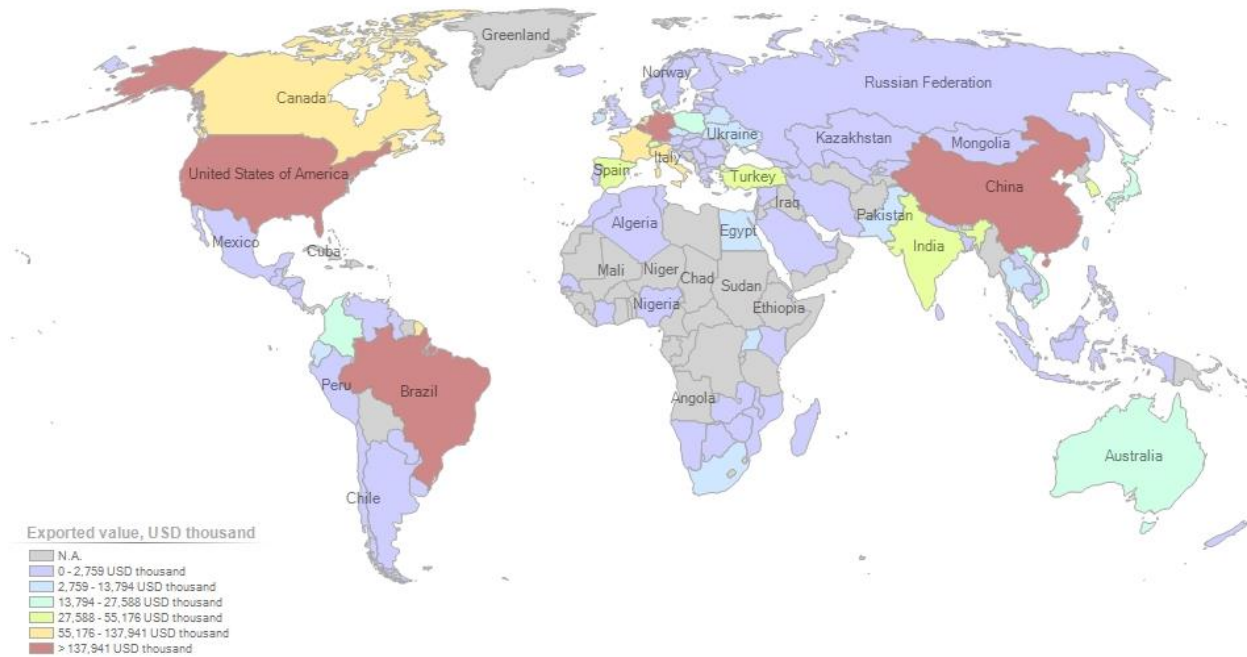

Figure 3: World Gelatin Export Map

² <https://www.aa.com.tr/tr/turkiye/boluda-helal-jelatin-uretimi-icin-fabrika-kuruluyor/1989103>

According to the Grand View Research Gelatin Sector 2019 report, as of 2019, the global gelatin market is 625.5 thousand tons and according to ITC data, the world gelatin trade volume is 3.5 billion dollars. The volume of the sector is expected to reach 915.9 thousand tons in 2027. ³

Approximately 40% of the world gelatin market is concentrated in Europe and 32% in America. Europe is the world's largest producer and consumer.

1.4. Foreign Trade

When the world export and import volume is analyzed according to the ITC data, the product whose CTSP Code is 35.03.300 (Gelatin, Gelatin Derivatives, Fish Glues, Animal Glues), realized 1.7 billion dollars export and 1.8 billion dollars imports in 2019. Turkey has a very low share in the world gelatin trade volume.

When the world exporting countries are analyzed, Brazil, Germany, China, America, Belgium, France, Netherlands and Italy take the biggest share respectively. Brazil, which ranks first among the exporting countries, accounts for 8% of the global gelatin trade volume in 2019.

Figure 5. World Gelatin (CTSP 35.03.300) Export Top 5 Countries (Thousand Dollars)

Source: ITC

When the world importing countries are examined, the USA, Germany, Japan, England, Canada, Belgium, the Netherlands and France take the first places, respectively.

1.4.1. Export

Turkey's gelatin export consists of five main product groups namely "gelatin", "other glues of animal origin", "gelatin capsules", "bone glues" and "gelatin derivatives", and the subject of this pre-feasibility study is the production of "gelatin". In this respect, the export information of "gelatin" and other gelatin products for the years 2015-2019 are presented below.

Gelatin Export

When the gelatin export is examined, a total of 205,107,466 kg export was realized between 2015-2019. It is seen that exports have increased gradually over the 5-year period, and there has been an increase of 1s48% from 2015 to 2019. While European countries such as Germany, Spain and Switzerland are among the destinations with most of exports, there are also Middle Eastern countries such as Iran and Iraq.

Table 10. Gelatin Export (kg)

| Countries/Years | 2019 | 2018 | 2017 | 2016 | 2015 |
|---------------------------|-------------|-------------|-------------|-------------|-------------|

Export of Gelatin Derivatives

When the export of gelatin derivatives is examined, a total of 3,709 kg export was realized between 2015 and 2019. In the 5-year period, most of the export was realized as 1,190 kg in 2019. Bulgaria and Serbia are among the top export countries. According to the gelatin derivatives export table covering the years 2015-2019, there is no country that exports regularly.

Table 11. Gelatin Derivatives Export (kg)

Export of Other Glues of Animal Origin

When the export of othe glues of animal origin is examined, a total of 1,597,854 kg export was realized in 2015 and a decrease of 28% was realized in the 5-year period.

Germany, Italy and Spain are among the countries with most of the exports in the last 5 years, and they correspond to 76% of the 5-year total exports.

Bone Glues Export

When the bone glues export was examined, a total of 4,049 kg export was realized between 2015-2019. In the 5-year period, the highest level of export was realized as 2.504 kg in 2017. In 2019, it is seen that no exports were made. Turkmenistan and Sudan are among the top export countries. According to the bone glues export table covering the years 2015-2019, there is no country that exports regularly.

Table 14. Bone Glues Export (kg)

As can be seen from the tables above; the production of gelatin, which is the subject of this feasibility, has the biggest share in the exports of these products, both in terms of quantity and value.

1.4.2. Import

Gelatin Import

Between 2015-2019, there was a 37% decrease in gelatin imports, and there was a steady increase in 2015-2018. Brazil and Argentina are among the countries with the highest import.

Table 15. Gelatin Import (kg)

Gelatin Derivatives Import

Between 2015-2019, the import of Gelatin Derivatives was 55.552 kg in total and there was a 40% decrease in the 5-year period, with irregular purchases in 2015-2019. Germany is the country from which Turkey makes most of the purchases and an increase over 100% was realized between the years 2015-2019. Germany consitutues 69% of Turkey's total Gelatin Deriatives import in the 5-year period.

Table 16. Gelatin Derivatives Import (kg)

| Countries/Years | 2019 | 2018 | 2017 | 2016 | 2015 |
|-----------------|--------|-------|-------|-------|--------|

Import of Other Glues of Animal Origin

When the Import of Other Glues of Animal Origin is examined, a total of 1,680,196 kg export was realized between 2015-2019. In the 5-year period, the highest export was 381,946 kg in 2019. Germany and Spain are among the top import countries.

Table 17. Other Animal Glues Import (kg)

| Countries/Years | 2019 | 2018 | 2017 | 2016 | 2015 |
|-----------------|---------|---------|---------|---------|---------|

Gelatin Capsules Import

Imports of Gelatin Capsules increased by 21% between 2015-2019, and there is a steady increase in 2015-2019. Belgium and South Korea are among the countries with the highest import. European countries such as France, the Netherlands, Germany constitute 80% of the five-year Gelatin Capsules Import of Turkey.

Table 18. Gelatin Capsules Import (kg)

| Countries/Years | 2019 | 2018 | 2017 | 2016 | 2015 |

Figure 7. Turkey Gelatin Industry Foreign Trade Assessment

According to export and import data of gelatin and related products of Turkey examined in detailed between 2015-2019;

- ***Gelatin exports increased by 40% between 2015-2019.***
- ***Despite being an importer in Gelatin Derivatives trade, it increased its export by 56% between 2015-2019,***
- ***As the sector is new in Turkey, it has a low share in World trade,***
- ***Production in the sector is performed by the four companies mentioned above,***
- ***The trade volume of the sector is mainly ensured by four companies as in production.***

In the annual industrial product statistics published by TURKSTAT, these figures could not be reached due to the confidentiality of the data related to the production and sales of gelatin and its derivatives in accordance with Article 13 of the TURKSTAT Law No. 5429. In this respect; it is not possible to accurately calculate total supply, domestic and total demand.

However, based on the realized export and import amounts and the food gelatin production capacity in the TOBB Database, the total supply and demand have been tried to be calculated. This calculation is based on the following assumptions.

- ☐ *Total supply equals total demand,*
- ☐ *Production is made up to the installed capacity,*
- ☐ *Export and import figures are calculated based on 2019 data,*
- ☐ *Exports are subtracted from the total of manufactured products and imports, the remaining product being consumed domestically,*
- ☐ *Based on the fact that no incentive certificate has been issued for the said investment for more than 5 years, the installed capacity obtained from TOBB Database in August 2020 was predicted to be the same in 2019, and the domestic demand amount was estimated to be 5.2 thousand tons.*

Table 22: Domestic Demand for Gelatin and Gelatin Derivatives

| <i>Indicators</i> | <i>Kg</i> |
|------------------------|-------------------|
| <i>Production</i> | <i>9.861.600</i> |
| <i>Import</i> | <i>2.211.260</i> |
| <i>Total Supply</i> | <i>12.072.860</i> |
| <i>Export</i> | <i>6.875.599</i> |
| <i>Domestic Demand</i> | <i>5.197.261</i> |
| <i>Toplam Talep</i> | <i>12.072.860</i> |

Source: Calculated based on TURKSTAT and TOBB Industry Data (Access Date 24.07.2020)

Considering the steady increase in exports over the years, the increasing demand for gelatin produced according to Islamic methods, and the continuous growth of world gelatin trade volume, it can be said that the demand for gelatin will increase steadily in the coming periods (provided that extraordinary issues such as pandemics etc. are not experienced).

On the other hand, when Turkey gelatin export and import realizations are evaluated together, import decreased regularly in parallel to the increase of domestic production. In this respect, it can be said that if the investment in the said facility is completed and production starts, imports will decrease, exports will increase further and this will contribute positively to the balance of payments.

Note: If product-based world export and import data are not the same; countries to register by defining GTIPs with different codes in customs clearance; While buying FOB / FCA value in export; It was stated in an expert opinion that there may be reasons such as CIF / CIP value taking in import.

1.5. Production, Capacity and Demand Estimation

As stated in previous sections;

- Gelatin production in Turkey is carried out by only 4 firms actually.
- Over the years, imports increase along with exports, but the increase in exports is higher than imports except 2019, amounts of imports are decreasing. Brazil stands out and draws attention in imports.
- Although domestic consumption is not known exactly as production figures cannot be reached, it can be easily said that it will grow in parallel with the expansion of the food sector.
- Incentive certificates were screened and no incentive certificate was found for gelatin. Of course, it is possible to say that the installed capacity will remain the same in the medium term, although it does not constitute a final position.
- Gelatin exports are expected to continue to grow by 1.2% and foreign trade by 1.1% in the coming years.

Figure 8. Development of Turkey's Gelatin Foreign Trade

Table 23. Growth Rates in Gelatin Foreign Trade

| Items/Years | 2016 | 2017 | 2018 | 2019 | Average |
|---------------|------|------|------|------|---------|
| Export | 1,27 | 1,52 | 1,24 | 1,04 | 1,27 |
| Import | 0,89 | 0,77 | 0,56 | 1,65 | 0,97 |
| Foreign Trade | 1,06 | 1,17 | 1,03 | 1,14 | 1,10 |

Within the framework of the aforementioned issues and expectations, the installed capacity for the facility has been selected as not aggressive but taking into account the economies of scale.

1.6. Input Market

Gelatin can be produced from different collagen sources. For commercially produced gelatin, generally bovine bones and leather, pig skin and especially recently fish skin are also used. The raw material of the gelatin to be produced at the facility is bovine (cattle) bones. Since ovine bones cannot provide the desired quality and yield, they are not used in gelatin production.

The raw materials used in gelatin production and their usage rates are given below. Accordingly, it is seen that pig skin and bones have a significant share in global gelatin production.

Figure 9. Distribution of Gelatin Production According to the Raw Material Used

Source: Preparation and Processing of Religious and Cultural Foods

The amount of cattle slaughter done in Konya and selected provinces as of 2015-2019 is given in the tables below. For the selection of the provinces, the number of slaughterhouses, the number of animals, the prevalence of beef cattle breeding and the distance to Konya were taken into account.

Considering the number of cattle, slaughterhouses and chopping facilities and the distance to Konya, the provinces with the highest potential to provide regular bone for the facility are Ankara and Afyonkarahisar.

Table 24. Approved Slaughterhouse and Chopping Facility

| Province | Slaughterhouse and Shredding Facilities | Distance from Konya |
|-----------------------|---|---------------------|
| Konya | 30 | - |
| Karaman | 2 | 110 km |
| Afyonkarahisar | 46 | 227 km |
| Burdur | 8 | 271 km |
| Aksaray | 4 | 151 km |
| Ankara | 97 | 262 km |
| Eskişehir | 12 | 330 km |
| Antalya | 35 | 302 km |
| Isparta | 7 | 240 km |
| Niğde | 3 | 249 km |
| Nevşehir | 4 | 221 km |
| Kırşehir | 4 | 243 km |
| Sivas | 12 | 502 km |

Source:

<http://ggbs.tarim.gov.tr/cis/servlet/StartCISPage?PAGEURL=/FSIS/ggbs.onayliisletmeSorgu.html&POPUPITIT/LE=AnaMenu> data were used.

On the other hand, the calculations regarding the bone potential that can be obtained with the cattle assets of the provinces listed in the table above in terms of raw material supply, except the slaughterhouse and chopping facilities, are given below. As only the statistics of number of animals slaughtered throughout Turkey are used by TSI when doing calculations on province basis, the number of animals slaughtered and data about bone that can be obtained by province were calculated based on average values for Turkey.

In this respect, average bovine carcass weight is 240 kg in our country as of 2015-2019, and the amount of bone obtained from bovine carcass with a calculation of 15% is approximately 36 kg. According to the average of 2015-2019, the potential amount of bone to be obtained from the twelve provinces determined is calculated below.

Konya: 194,383 animals x 36 kg = 6,998 tons fresh bones

Karaman: 15,119 animals x 36 kg = 544 tons fresh bones

Afyonkarahisar: 84,228 animals x 36 kg = 3,032 tons fresh bones

Burdur: 49,006 x 36 kg = 1,764 tons fresh bones

Aksaray: 53,819 x 36 kg = 1,937 tons fresh bones

Ankara: 102,220 x 36 kg = 3,680 tons fresh bones

Eskişehir: 32,970 x 36 kg = 1,187 tons fresh bones

Antalya: 40,094 x 36 kg = 1,443 tons fresh bones

Isparta: 33,518 x 36 kg = 1,207 tons fresh bones

Niğde: 36,239 x 36 kg = 1,305 tons fresh bones

Nevşehir: 19,708 x 36 kg = 709 tons fresh bones

Sivas: 72,955 x 36 kg = 2,626 tons fresh bones

Hinterland Total: 26,432 tons fresh bones

Turkey General Potential Bone Quantity: 131,957 tons fresh bones

With the raw material collection centers to be established, approximately 20% of the cattle bones produced in the country will be covered. However, if needed, fresh bones can be obtained from other provinces.

Table 25. Cattle Stock and Number of Slaughtered Cattle

1.7. Market and Sales Analysis

The production of gelatine permanently increases and as a result, Turkey switched from importer to exporter position. In last years, it has found wide usage area in many sectors and many products due to its stabilizer, thickener, strong shaping ability, transparent gel formation, flexible film formation, easy to digest, soluble in hot water and easily shaping properties. As it is preferred compared with other alternative products due to its protein predominance and other advantages indicates that the consumption of gelatin will increase in the coming periods.

As there is a wide range of usage areas for the gelatin supplied by the branches of world manufacturers present in Turkey or by direct importation from the world and as it is a delicate product in the sense of “halal food” for the consumers of food sector, the company that will produce this product in Turkey has to take into consideration this sensibility for the raw material used.

Regarding Konya, in the "Past, Present and Future of Konya Food Sector"⁴ report prepared by Konya ABİGEM, supported by Mevlana Development Agency, the number of registered producers in chocolate production on the basis of sub-sectors is 49, the installed capacity is 55,542 tons, the number of registered companies in soft candy production is 11 with an installed capacity of 9,894 tons and their presence further demonstrates the potential for gel use.

When considering Konya food industry, the priority market for the produced gelatin will be Turkey with Konya and Karaman at the top positions and the Islamic countries in the long term.

⁴ <https://www.kalkinmakutuphanesi.gov.tr/assets/upload/dosyalar/6-gida.pdf>

However, when the investment is made regarding feasibility for a healthy market and consequently regular product sales, the manufacturer should analyze the structure of the sector well and organize the sales and marketing channels in accordance with the intense competition conditions in the market and contact the users of the product at the stage of the investment and make sales connections in advance. The company should focus on advertising within the framework of sales and marketing activities at the initial stage of investment and introduce the product to domestic companies with all its features. At this stage, they should contact the important users of the product (Eti, Ülker, Kent, Saray, etc.) and inform them about the stages of the investment to be made and the product to be produced, and should convince the consumers of the product regarding the quality of the product and make connections. In the next stage, advertisements should be published in mass media, while developing a sales-marketing-distribution channel, and on the other hand, the producers in the world should be followed and R&D studies should be focused on. At this stage, it is considered to be beneficial to advertise both in the media organs of the industries where gelatin is used and in the sectoral media organs of the customer group. Promotion can be made by participating in sectoral fairs. Web pages that provide detailed information about the products and production conditions can be designed to promote the product both in the country and abroad.

The subject of feasibility is competitive in terms of the investors in obtaining the gelatin from the existing domestic producers and the distributors of foreign companies or through importer companies; in order to be able to hold on to the market by launching its own brand, the raw material study should especially be done well, it shall have a flexible structure in product diversification according to customer demands, focus on advertising and R&D studies, and it should be aimed to meet the gelatin needs of the sectors in different blooms under competitive prices and sales conditions.

The company should focus on advertising within the framework of sales and marketing activities at the initial stage of investment and introduce the product to domestic companies with all its properties. At this stage, they should contact the important users of the product (Eti, Ülker, Kent, Saray, etc.) and inform them about the stages of the investment to be made and the product to be produced, and should convince the consumers of the product regarding the quality of the product and make connections.

- Product Sales Prices and Conditions

The fact that gelatin is a natural protein and has technologically important features is an indicator that its production and consumption will continue to increase in the coming years. However, for consumers with special preferences and sensitivities, gelatin production under controlled conditions and meticulousness in the use of resources and the concept of "halal food" are of great importance.

When the investment subject of the feasibility is completed; powder gelatin will be produced in various blooms from bovine (cattle) bones at the facility. The average sales price of the gelatin to be produced is determined as 8.0 USD / kg excluding VAT, transportation if it is produced as the highest quality gelatine in the market according to the selection of the technology to be used in the facility. The

quantity and sales prices of the by-products that will be released in production are given in the Technical Review and Evaluation section of the report.

- **Estimated Sales Projection for the Facility-CUR**

It is estimated that if the sales and marketing organization is sufficient and the production is made in the desired conditions and quality in the market and as long as sufficient raw materials are available, there will be no sales problems.

Due to the small number of gelatine manufacturer in Turkey, constantly increasing exports, the use of gelatin in many sectors especially in recent years, the increasing importance of the halal food concept; if production is made in the desired quality and conditions, it is predicted that the sales will increase steadily starting from the first years and reach a high capacity utilization rate in a short time.

When considering that the installed capacity in Turkey, as mentioned in the previous sections, is 9,862 tons, and that domestic consumption is approximately 5,200 tons, 1,500 tons installed capacity means an addition of 15% to the available capacity and a 29% share from the domestic demand. Considering the growth rate of foreign trade, even if the facility operates with 100% CUR, it presents a possible structure.

Production capacity utilization rate will depend entirely on fresh bone supply. CURs as of the projected years and the related fresh bone need are predicted as follows.

Table 26. Projected Capacity Utilization Rates by Years and Raw Material Requirements

| | <i>First Year</i> | <i>Second Year</i> | <i>Third Year</i> | <i>Fourth Year</i> | <i>Fifth Year +</i> |
|---|-------------------|--------------------|-------------------|--------------------|---------------------|
| Projected Capacity Utilization Rate For 1500 TONS INSTALLED CAPACITY (%) | 50% | 60% | 75% | 85% | 90% |
| Projected Production Amount of Gelatin (Tons) | 750 | 900 | 1125 | 1275 | 1350 |
| Required Amount Of Bone | 12.750 | 15.300 | 19.125 | 21.675 | 22.950 |
| Total Bone Potential in the Region (Ton) | 26.432 | 26.432 | 26.432 | 26.432 | 26.432 |
| The Amount of Bone That Can Be Collected by the Facility (%) | 48% | 58% | 72% | 82% | 87% |

CUR forecasts will be subject to the following conditions;

- The investor company will start the raw material procurement studies close to the completion of the investment.*
- Preliminary agreements will be signed with slaughterhouses in provinces within the hinterland.*
- Fresh bone tenders of public institutions will be followed.*
- The purchasing organization foreseen in the technical department will be realized.*

3. TECHNICAL ANALYSIS

3.1. Selection of Facility Location

Halal gelatin production, which is of special importance in terms of halal food production for our country, is one of the appropriate investment issues. The width of the area is also important as post-production treatment is required. In this sense, land prices will also gain importance. A 50,000 m² land is required for the facility. During the meetings with Konya Organized Industry Directorate, it was stated that no land was available for allocation. In this case, research was conducted in the districts and in the meeting with the manager of the Beyşehir Organized Industrial Zone, the **establishment of a new organized zone was mentioned and if a well is requested, water will be reached at 150 meters.** While determining the cost in the selection of land, the land unit price of this region was taken as a basis. Considering the important criteria for gelatin production, site selection predictions for Konya are given below.

Table 27. Evaluation Regarding Location Selection

| | |
|--|---|
| ECONOMIC FACTORS | <i>In terms of economic factors, Konya is in a position to provide raw materials for gelatine production from neighboring provinces. Since the gelatin market is open both domestically and internationally, the presence of an airport and a railway makes an advantage in the choice of province. The use of pressure vessels in production raises the issue of energy costs. Having natural gas in the city will affect the costs positively, even a little. It does not differ from other provinces in terms of construction costs.</i> |
| Raw Material | |
| Proximity to the market | |
| Energy / Combustible | |
| Labor | |
| Construction Coat | |
| NATURAL FACTORS | <i>In Konya, one of Turkey's top provinces with low rainfall, there is a significant reduction in groundwater. Annual usable water resource in Konya Closed Basin is 4.5 billion and consumption is 6.5 billion cubic meters. Due to the low amount of precipitation, water reserves are rapidly decreasing. Water, which is one of the most important cost items in gelatin production, must be supplied from the field. Therefore, considering the underground water reserves of Konya and its districts, site selection should be made carefully in terms of gelatine production. Konya, which is a province with low earthquake risk, is suitable for investment in this sense.</i> |
| Climate conditions | |
| Land / Plot status | |
| Natural Resources / Water | |
| Earthquakes and natural disasters | <i>In terms of social factors, Konya province is suitable for this investment. There is potential for a trained workforce. There will be no resistance in the society regarding this investment issue.</i> |
| SOCIAL FACTORS | |
| Trained workforce | |
| Society Resistance | |
| POLITICAL FACTORS | |
| State, Economic and social support and local administration supports | <i>All the incentives foreseen by the state for investment can be used in Konya.</i> |

| | |
|------------------------------------|---|
| | |
| OTHER FACTORS | <p><i>Considering other factors on the basis of Konya province, it will be seen that there is no difference compared to other provinces. However, considering the treatment, which is one of the most important costs and operating expenses of the investment, having an Organized Industrial Zone in the province may make Konya more attractive.</i></p> |
| <i>Supply of labor force</i> | |
| <i>Transportation Services</i> | |
| <i>Materials and services</i> | |
| <i>Legislative power bodies</i> | |
| <i>Financing</i> | |
| <i>Disposal of water and waste</i> | |

3.1.2. Production Technology

The gelatin industry constantly develops new products with intensive technology investments, and the usage areas of the produced gelatin and its derivatives are expanding. There are different production processes that can provide the most suitable conditions for the raw material used and / or the usage area and properties of the gelatin to be produced. With the technologies developed in recent years, more than 25% savings have been achieved in energy and process water consumption used in production, while the quality and efficiency of the obtained product has been consistently increased significantly.

We can talk about small and large scales in current technologies. Gelatins produced in small scales are generally those that use fish and poultry raw materials.

Use of Fish as Raw Material

Fish gelatin is generally derived from fish skin and can be conditioned using both acid and alkali. The skins can be provided from fish processors working in conjunction with fish farms or from boats making fillets (fish without bones) in the sea. However, fish skins must be thoroughly cleaned to remove the remaining oils. There it is defrosted, washed several times and treated with mineral or organic acids for a period of 24 hours. Rarely, it is also pre-treated first with lime milk to bind residual fat.

The characteristic properties of gelatin obtained from different types of fish and its usage areas also vary. For example, gelatin obtained from fish in the cold waters of the North Atlantic Region has a low gelling power, since it contains very low amounts of proline and hydroxyproline. On the other hand, these gelatins show a good film formation and have emulsifying properties. For this reason, they are especially preferred for the integration of oil-based vitamins using the spray drying technique. On the contrary, gelatin obtained from fish taken from warmer waters has a good gelling property. Since their structure is very close to other common gelatins, they are frequently used in the food and pharmaceutical industry.

Today, fish gelatin is much more expensive than traditionally obtained gelatin. This is due to the high cost of transportation and the low density of collagen in the fish skin. On the other hand, although fish bone seems suitable for gelatin production, after many studies, the gelatin industry has opposed the use of this material for economic reasons. Although fish gelatin is also a food item, there are different legal regulations in different countries regarding its allergic potential.

Use of Poultry as Raw Material

Poultry gelatin is also obtained from both fresh skin and bone materials. Since poultry are generally young when slaughtered, the material can be treated with the acid process. Poultry skins contain a lot of fat and their collagen concentration is low. For this reason, feet and similar materials are also used. Since the poultry is not demineralized normally prior to conditioning and the concentration of salts during extraction is high, a precipitation process is required after extraction. Excess salts are removed in other stages such as ultrafiltration and deionization

However, poultry gelatine production remains a niche product for now, at least in the medium term, due to the fact that skin from poultry is a raw material that is in high demand for other food applications and due to the high costs.

Collagen, which is found in cattle and pigs, is used as the main raw material in large-scale gelatin production in terms of availability and product quality. The use of collagen in fish and poultry as a raw material is more recent and is generally produced as a niche product to meet the demands of consumers of certain religions. However, although the raw materials used in gelatin production are different, the common point of all of them is that they are of animal origin.

Use of Bovine Skin as Raw Material

Another main source of collagen used in gelatin production is bovine skin. The thickness of the skin depends on the climate of the place where the cattle grows. The warmer the climate, the thinner the skin becomes. The outer skin contains less collagen and is used almost exclusively in the leather industry. The fleshy face consists of fatty tissue and is removed as a by-product while the skin is being processed. However, the middle layer called "split" is almost pure collagen, so it is an excellent raw material for gelatin production.

After treatment with alkali, the swollen hairs from the skin are removed and then the skin is divided into three separate layers with horizontal blades. With this process, it is ensured that the part called "split" is exposed. Splits can reach up to 4 m² in size depending on the age of the animal. The resulting splits are first cut into hand-sized pieces in cutting machines in gelatin plants and then treated with acid or alkali. In principle, non-delaminated pieces of leather can also be processed, but in this case, the skin must be de-haired by previously treated with an alkali / sulphite solution. In this case, operating efficiency and productivity are reduced as the yield is significantly reduced due to the lower collagen content. Shrinking the skin is essential for effective conditioning. Extraction is facilitated by acid and alkali processes.

One of the most important problems of the leather industry in the world and in our country is industrial waste. It is very important to use these wastes and to bring them to the economy of our country in terms of solving environmental problems and producing products with high added value. Leather solid wastes are in the category of economic value wastes due to their proteinic properties, fibrous character and high natural fat content, and are also suitable for gelatin production.

Only 20-25% of the raw leather entering the leather industry turns into finished leather and therefore industrial solid wastes with different characteristics are generated during leather production. In recent years, the evaluation and disposal of leather solid wastes has gained great importance due to productivity and environmental problems. A wide variety of wastes are generated in the leather industry. Leather industry solid wastes differ in terms of content and amount depending on the process steps they occur.

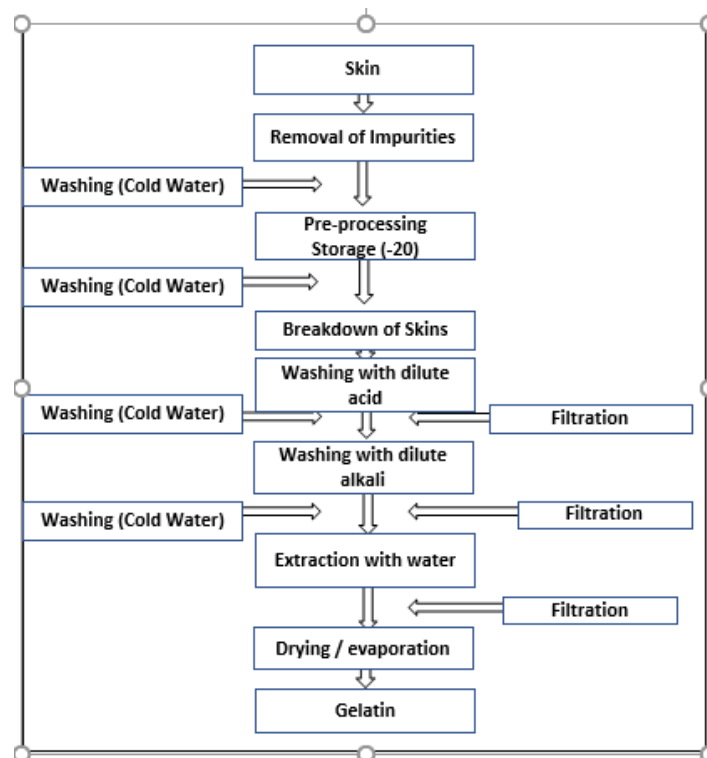

Gelatins are defined as A and B types, respectively, according to the use of acid and base in chemical hydrolysis application during production. Molecular structure of many amino acids also changes during the transformation of collagen into gelatin. Due to the different isoelectric points of A and B type gelatins, the amino acid composition is also different. The isoelectric point of type A gelatin varies between 7-9. The isoelectric point of B-type gelatin is around 5 as the amino acids asparagine and glutamine found in natural collagen are converted to acidic amino acids (aspartic and glutamic acids). Generally, A type gelatin is produced from pig skin and B type gelatin is produced from bovine skin with a more complex collagen structure.

After the outer part of the bovine skin containing less collagen and the inner fat layer are removed, the middle layer containing pure collagen remains and this layer is used as raw material for gelatin production. Hairs with low collagen content are removed from the skin in order not to reduce the gelatin yield. Later, by reducing the size of the skin, homogeneous distribution of alkali and acid applications and facilitation of extraction are ensured.

Continuous extraction method is used in the production of bovine gelatin. In this method, the raw material is continuously supplied to the extractor and high bloom value, low viscosity and light colored homogeneous gelatin is produced.

Generally, high quality gelatins are obtained from the raw material with a partially hydrolyzed collagen structure and homogeneous structure at 50 ° C temperature. Different piece size and the fact that the pieces are obtained from animals of different ages can negatively affect the homogeneous process. The extracted gelatin solution is purified by the manufacturers in different ways. Purification processes are mainly; It consists of filtration and clarification, deionization, concentration, sterilization, drying and packaging steps.

Figure 10. Bovine Skin Gelatin Production Scheme

As known, leather is a raw material that is highly demanded by non-food sectors. For this reason, it will be necessary to bear much more effort, competition and costs in raw material procurement compared to bone.

Use of Fresh Bone as Raw Material

In addition to fresh meat, fresh bone is also obtained in slaughterhouses and meat processing plants. This valuable source of collagen is a good osein (bone extract, bone glue) and gelatin raw material. In the production of osein, the bones are precisely crushed into cubes of approximately 0.5 cm in size, then they are defatted by washing vigorously with 85-95oC hot water for 30 minutes. With this process, leftover meat pieces that may remain on the bone are also removed completely. Then, the crushed bones are dried with hot air in the dryers operating in the continuous system and classified according to particle size by sieving. The classified bone fragments are then processed individually. During this process, oil (used in the chemical industry and by animal feed manufacturers in many countries), meat, and bone meal are obtained as by-products. Bone meal is mostly used as a fertilizer in Europe and America.

The gelatin production process described above consists of two basic stages, pre-treatment and extraction.

The purpose of the pre-treatment is to convert the water insoluble collagen in the raw material into water-soluble gelatin by treating it with acid or alkali. At this stage, a double method is often applied and after a short acid process the material is wetted with intense alkali. Then, the gelatin obtained can be obtained after five basic steps, mainly washing, extraction, purification, concentration and drying.

Pre-treatments

After complete cleaning of the raw material, it includes different pre-treatment steps, which are applied depending on the origin of the raw material.

Figure 11. Production Flow Chart

In gelatin production, two processing methods are used mainly:

Acid treatment method-for type A gelatin;

The raw material (primarily pig skin) is first subjected to a digestion process. Here, the material is treated with acid and the gelatin extraction process can be started immediately afterwards.

Alkali treatment method- for type B gelatin;

This process extends over a long period of time and calmly alters the structure of collagen. Only bone and skin pieces can be used here. Collagen produced in this way is dissolved in hot water.

Extraction

Hot water is then added to the pre-treated material and the multi-step extraction process is started. The first gelatin fractions obtained at low temperature have the highest degree of gelling. A solution of approximately 5% is obtained. The material is then extracted using fresh and hot water. This process continues until the smallest piece of gelatin is extracted using boiling water. The product is obtained as a result of extraction very close to complete.

Figure 12. Extraction

Purification

A gelatin solution of 5% approximately obtained from the extraction process is purified from oil and fiber residues by the use of high performance separators. Pre-treatment is completed by passing through the cleaner.

Pre-layer filters, which ensure the maximum amount of fine particles retention, are then passed through cellulose plate filters similar to those used in the beverage industry. The purified material is then passed through columns containing an ion exchange resin where gelatin is freed from calcium, sodium, acid residues and other salts, depending on the conditions.

Figure 13. Purification

Concentration

Ön ısıtma donanımlı çok kademeli vakum evaporatörler,jelatin solüsyonunu sterilize etmek için kullanılır. Aynı zamanda enerjinin minimum kullanımı ile, seyreltik çözeltiden yumuşak bir tarzda su uzaklaştırılarak bal kıvamında bir konsantre elde edilir. Yüksek viskos özellikteki solüsyon, daha **sonra** tekrar sellüloz plakalardan oluşan filtrelerinden geçirilir. Herhangi kalmış kalıntılar da uzaklaştırılmış **olur**.

Figure 14: Concentration

Grinding, Sieving and Blending

These are final processes, but they also are very important steps in the chain that require pre-preparation of gelatin for specific customer requests or different applications. Due to these conditions, different grinders and blenders are used. After the silos are filled, final controls are made by the quality control laboratory and they are packaged in sacks, bags and boxes and sent to the customer.

Figure 15: Grinding, Sieving and Blending

Drying

The highly concentrated gelatin solution is then rapidly subjected to a high temperature sterilization process, cooled and solidified as a re-sterilization process against potential hazards.

This process produces gelatin nodules evenly distributed over the dryer tray. There, the filtering, washing, pre-drying and the air preventing the germination dries the gelatin. To leave the desiccant, the hard and brittle gelatin is now shredded and ground to the same lump sizes. In this form, it is stored in the warehouse until the next operation is required. Before gelatin is used, chemical, physical and bacterial tests are performed.

Figure 16: Drying

- **Technology Selection, Production Method and Material Balance**

The Type B Alkali Production method foreseen for the facility is summarized below, and the flow chart for this is given in Figure 14. The item balance calculated according to the envisaged production method and flow chart is given in Table 23.

After the bones taken from the raw material warehouse (1) are classified, crushed and weighed (2), they are washed with hot water in a rotary bone washing machine to remove fat (3). By centrifugation, solid and liquid phases are separated (4). After separating the oils and water in the liquid phase obtained as by-products, the bone residues obtained are dried and used as animal feed. The main product, the crushed bones, are dried, sized and stored until certain sized batches are obtained (5) and then taken into acidification tanks (6). There, HCL reacts with minerals in the bones to form a by-product mono calcium phosphate (MCP). The MCP is obtained by treating with 15% lime milk and precipitating dicalcium phosphate (DCP). The concentration of 15% DCP in the solution obtained is first increased to 45% by vacuum. Then, 55% moisture in the solution is removed with a centrifugal flash dryer. On the other hand, demineralized bones, which are the main products, are first washed with cold water to remove excess HCL, then they are subjected to alkaline treatment with lime to obtain ossein, or bone extract (8). The production of ossein takes approximately 40-50 days.

Calcined ossein is first washed with cold water and purified from excess lime and then treated with sulfuric acid for approximately 2.5 days and neutralized to make its pH suitable for extraction (9). Gelatin is extracted by processing with hot demineralized water for approximately 16-20 hours and at different temperatures (40-80oC) in neutralized ossein extraction tanks (10). The 3-5% weak gelatin solution obtained is filtered through a press filter, and suspended impurities are removed and a clear solution is obtained (11). Filtered gelatin liquor is passed through ion exchangers to remove ash content and obtain a low conductivity liquor (12). Deionized gelatin liquor is passed through a triple-action evaporator and concentrated to 22-33% levels (13). The solution is sterilized by injecting fresh steam into the concentrated gelatin solution (14).

The sterile gelatin solution is fed to the votator (surface-scraped heat exchanger) system. There, gelatin, which is cooled to about 21oC and extruded at low temperatures, leaves the votator in stripes (15). Gelatin strips are fed into the belt dryer. There, by using dry and sterile air and generally increasing the temperature from 30oC to 50oC in eight steps, the humidity in gelatin is reduced from 25% to 10-12% (16). After the dried gelatin is ground to the desired particle size (17) and classified according to its size, it is taken into intermediate storage before blending (18). Products obtained in different batches are standardized by blending according to customer demands (19), automatically weighed and packaged in desired weights (20), then taken to the product warehouse until shipment (21).

Figure 17. Production Flow Chart

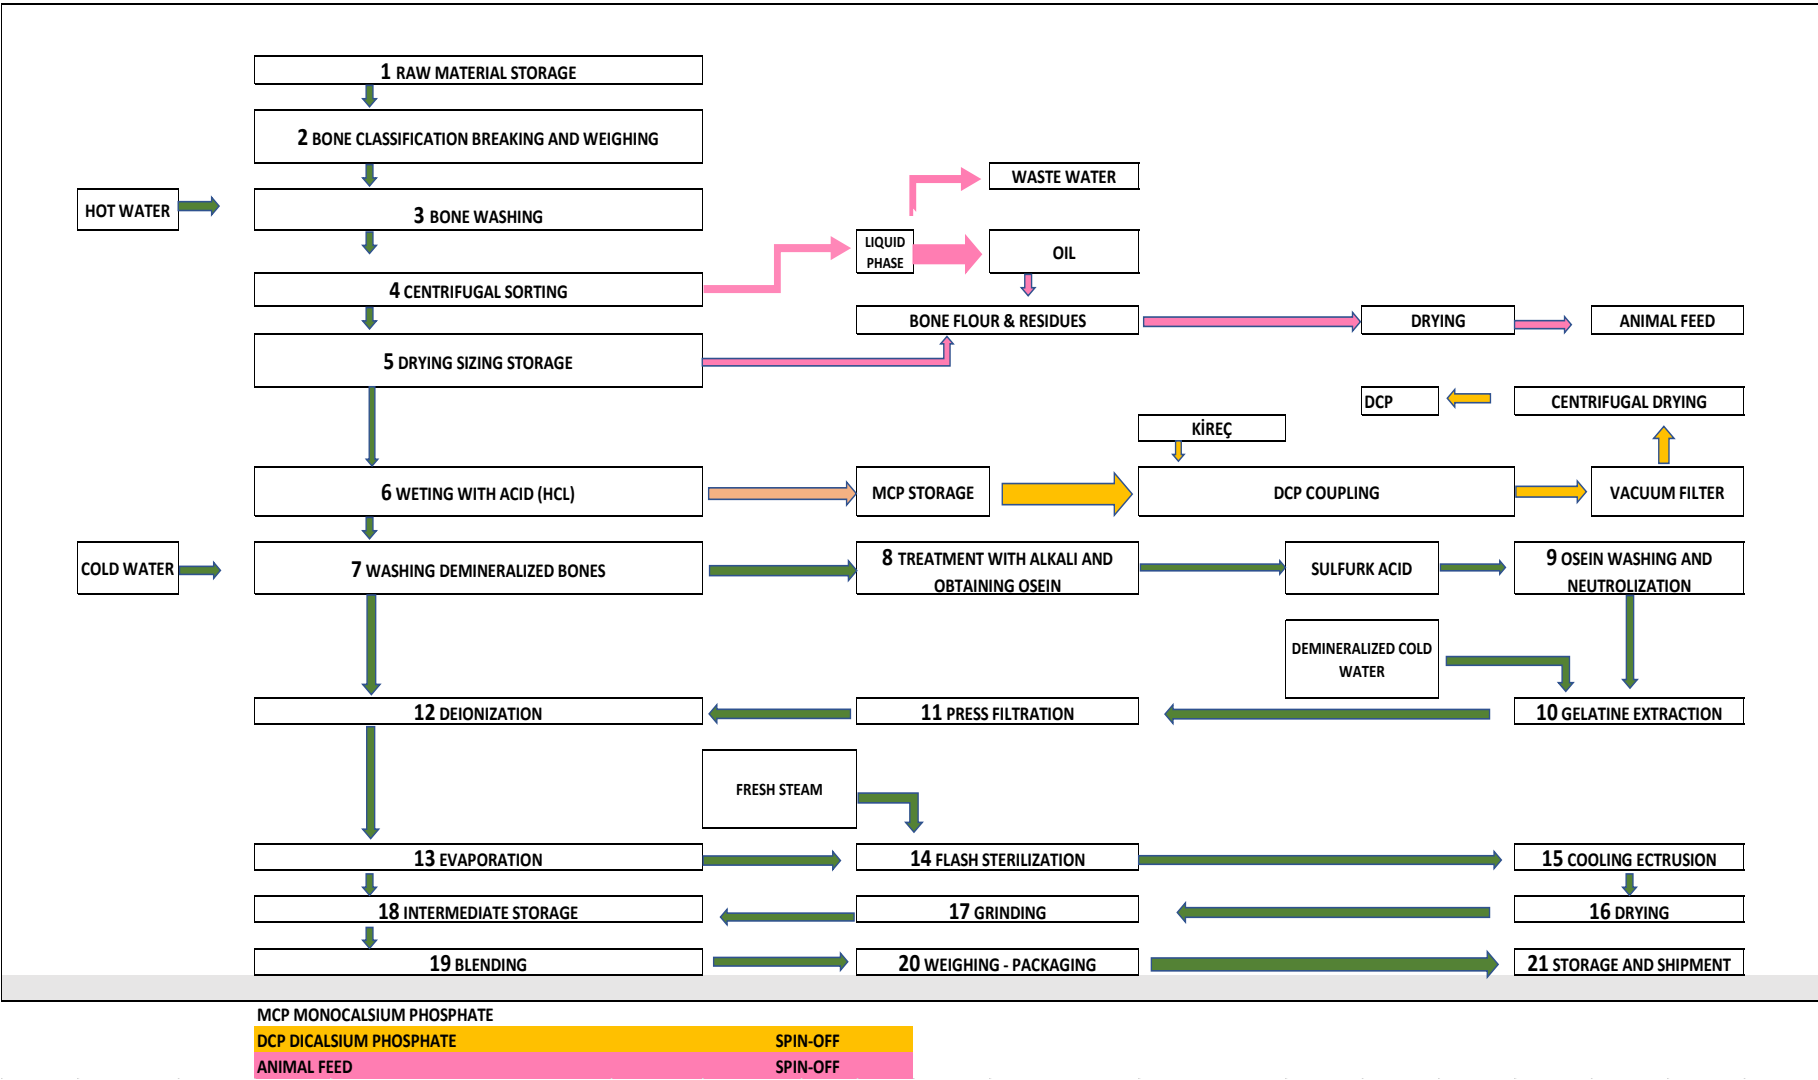

Table 28. Material Balance for the Selected Production Method

| PRODUCT OBTAINED IN THE PROCESS AND BY-PRODUCTS | % | AMOUNT |
|---|------|------------|
| | | TON / YEAR |
| INSTALLED CAPACITY (GELATIN) | | 1.500 |
| FRESH BONE | 100% | 25.500 |
| BONE OIL FROM FRESH BONE | 5% | 1.275 |
| DRIED BONE FRESH BONE | 35% | 8.925 |
| BROKEN BONE FOR GELATINE FROM DRIED BONE | 94% | 8.390 |
| BONE FLOUR FROM DRIED BONE AND OTHERS | 7% | 625 |
| OSEİN | 28% | 2.307 |
| DİKALSİYUM FOSFAT | 45% | 3.775 |
| GELATINE FROM OSEİN | 65% | 1.500 |

- Facility Installed Capacity, Production Schedule and Projected CUR

The total installed capacity of the facility is 300 days a year and 1,500 tons / year of powder gelatin production over 3 shifts / day. The determined installed capacities are theoretical, and the 300 days work has been taken into consideration considering the preparation and / or cleaning of machinery equipment for production, breakdown, repair and maintenance times, delay due to labor force, etc.

Bone oil, bone meal and dicalcium phosphate will be obtained as by-products at the plant. The amount of product to be obtained at full capacity is shown in the table above. It is thought that the most important parameter that will limit the production amount in the facility will be the raw material supply. Apart from this constraint, full capacity operation is envisaged with the necessary maintenance and repair measures and the provision of technical personnel.

3.1.3. Human Resources

With the commencement of the investment activities, it is envisaged that 153 blue and white collar employees will work at the facility. When the socio-economic development of Konya province, its proximity to Ankara and Antalya, its developed industry, the presence of more than one university, many vocational high schools, and as it can be seen in the table below, its young population over the average of Turkey are taken into consideration, providing the staff required will not be difficult. The distribution and organization chart of the foreseen 153 personnel are given below.

Table 32. Turkey and Konya Young Population

| Year | Indicators | Turkey | Konya |
|------|-----------------------------------|------------|-----------|
| 2019 | Total Population | 83.154.997 | 2.232.374 |

4.1.1. Land Investment

The establishment of the facility is planned on a 50,000 m² land. Due to the excessive amount of water used in gelatin production and the negative effects of waste water generated after production, some criteria were taken into account in the selection of the land to be determined for investment. First of all, the zoning status, water, energy, natural gas and purification properties were taken into consideration. Land status and organized industrial zones of Konya and its districts have been taken into consideration. In the meetings with Konya Organized Industrial Zones Directorate which are in the city centre, it was stated that there is no land that can be allocated (while the report is preparing period). In the meetings made with the Organized Industry Directorate of Beyşehir, one of the *districts of Konya*, it was learned that the second organized industrial zone would be opened in about seven months and a land could be found for 20 TL / m².

Within the scope of this information, the price of a 50,000 m² land is 50,000 m² x 20 TL / m² = 1,000,000 TL (145,900 USD).

4.1.2. Survey and Project Expenses

The number of companies in the world that can produce all the necessary machinery and equipment for gelatin facilities and establish turnkey facilities is limited. On the other hand, although the production of gelatin seems easy, since it is not a known technology, it will be a very difficult process to produce gelatin in the desired quality and in accordance with customer demand and to design a production facility accordingly.

On the other hand, Incentive Certificate required to be obtained during the investment period, environmental permits (the investment is not within the scope of EIA but within the scope of Environmental Permit and License Regulation of the Environment Law), business licenses, necessary laboratory analyzes, brand registrations, HACCP (FOOD SAFETY MANAGEMENT SYSTEM CERTIFICATE) - Quality and / or product conformity certifications such as ISO, TSE, Halal Food Certificate are also taken into account in this item. In this context, a total expenditure of 200,000 USD is foreseen for survey and project services and engineering services.

4.1.3. Construction Expenses

A land of 50,000 m² is required for the facility and 25,000 m² of closed construction area is required for a production capacity of 1,500 tons of gelatin. According to the Ministry of Public Works' approximate unit cost classification for buildings, integrated agricultural industry structures are in Class III Group B. Accordingly, the unit cost in the construction cost calculation of the facility was taken as 1,450 TL / m² (211.55 USD / m²).

For a capacity of 1,500 tons;

25,000 m² X 211.55 USD = 5,288,750 USD

Due to the use of too much water in production, it is envisaged to drill a well within the factory site. Provisions regarding research, extraction and use of water should be applied to meet the conditions specified in DSI UNDERGROUND WATER TECHNICAL REGULATION for exploration and extraction of underground water resources to open the well. In calculating the cost of the well, the unit prices of TMMOB Geophysical Engineers Chamber 2020 were taken as a basis. It is predicted that water can be removed from approximately 150 meters in the field. Approximately 100,000 TL (15,000 USD) is expected to be spent. Total construction cost is 5,303,750 USD.

4.1.4. Machinery and Equipment Expense

The list and prices of necessary machinery and equipment for the facility are given in the Annex for a capacity of 1,500 tons. The main machinery and equipment amount defined based on the offer

received from Nantog Keda Chemical Machinery (<http://www.snsjzy.com/eims/plus/list.php?tid=5>), one of the largest machinery manufacturers in this sector and able to offer complete turnkey offer, is 10,670,580 USD on turnkey basis including treatment. Detailed machinery equipment list is given in the attachment.

4.1.5. Transportation and Insurance Expenses

Main machinery and equipment will be imported from abroad. 5% of FOB price is taken for transportation by ship and insurance and 1.5% for domestic transportation of main machinery and auxiliary units machinery equipment.

4.1.6. Import and Customs Expenses

Since the investment is planned to be made with an incentive certificate, imported machinery and equipment will be exempt from customs duty and no expenditure is envisaged for this item.

4.1.7. Installation Expenses

USD 220,000 is foreseen as an expense for the installer services to be provided by the manufacturer for the assembly of the main machinery and equipment, and for the installer services for auxiliary machinery and equipment.

4.1.8. Vehicles and Fixtures Expenses

For vehicles, a total of USD 354,654 is foreseen for one automobile (300,000 TL), two midibus type (580,000 TL) for general purpose use such as worker-material transport, etc., one flatbed van type commercial vehicle (180,000 TL), two 20-ton capacity frigofrig trucks (200,000 USD) for raw material transportation.

On the other hand, the necessary fixtures such as office materials and devices for the facility, etc. (telephone switchboard and devices, computer and softwares, fax, photocopy machine, air conditioner, tables, armchairs, cabinets, etc.), were estimated as USD 100,000. In this case, a total of 454,654 USD has been foreseen for vehicle and fixtures expenses.

4.1.9. Start-up Expenses

Commissioning expenses covering the expenses that may arise during the control phase of the operation of the installed machinery and equipment; for expenses such as energy to be used, material and labor in stages such as testing, setting and trial production are estimated as USD 200,000.

4.1.10. General Expenses

Approximately 1% of the fixed investment amount (up to there) has been taken as communication, announcement, travel and similar expenses of the investment period and personnel and general management expenses of the investment period.

4.1.11. Contingencies

It is estimated that there may be a physical and financial unexpected expense of approximately 2% of the expenses up to this item.

Table 37. Investment Implementation Plan

| INVESTMENT ITEMS | 1. YEAR | | | | | | | | 2. YEAR | | | | | | | | | | | |
|------------------------|---------|---|---|---|---|----|----|----|---------|---|---|---|---|---|---|---|---|----|----|----|
| | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 |
| LAND | | | | | | | | | | | | | | | | | | | | |
| PROJECTS | | | | | | | | | | | | | | | | | | | | |
| CONSTRUCTION | | | | | | | | | | | | | | | | | | | | |
| MACHINERY & EQUIPMENT | | | | | | | | | | | | | | | | | | | | |
| TRANSPORT & INSUARENCE | | | | | | | | | | | | | | | | | | | | |
| ASSEMBLY | | | | | | | | | | | | | | | | | | | | |
| VEHICLES & FIXTURES | | | | | | | | | | | | | | | | | | | | |
| STARTUP | | | | | | | | | | | | | | | | | | | | |

The investment implementation program, which has been prepared in terms of main investment items, taking into account the above-mentioned transactions, has been given. Accordingly, it is predicted that the investment process can be completed and the facility can be put into operation in about 20 months.

4.2 Return on Investment

The return on investment is calculated as 4 years and 10 months. Due to the sensitivity of the production and the market in gelatine production, an appointment could not be obtained with the manufacturers.

5. ENVIRONMENTAL AND SOCIAL IMPACT ANALYSIS

The investment is not within the scope of EIA, but is under the Environmental Permit and License Regulation of the Environment Law. In case of necessity to drill a well, necessary permissions should be obtained and the periods of obtaining these permissions should be taken into consideration in detailed feasibility studies.

Investment has the ability to provide added value due to the employment it will provide. In addition, considering the intensity of confectionery and food industry in neighboring provinces, especially Konya, it will also support the raw material input of this sector.

In addition, if the investment is realized in Beyşehir OIZ, which is about to be completed, it is expected that both the interest in the OIZ will increase and the commercial life of the city will be activated.
